# Disclaimer

SolidProof.io reports are not, nor should be considered, an “endorsement” or “disapproval” of any particular project or team. These reports are not, nor should be considered, an indication of the economics or value of any “product” or “asset” created by any team. SolidProof.io do not cover testing or auditing the integration with external contract or services (such as Unicrypt, Uniswap, PancakeSwap etc’...)

**SolidProof.io Audits do not provide any warranty or guarantee regarding the absolute bug- free nature of the technology analyzed, nor do they provide any indication of the technology proprietors. SolidProof Audits should not be used in any way to make decisions around investment or involvement with any particular project. These reports in no way provide investment advice, nor should be leveraged as investment advice of any sort.**

SolidProof.io Reports represent an extensive auditing process intending to help our customers increase the quality of their code while reducing the high level of risk presented by cryptographic tokens and blockchain technology. Blockchain technology and cryptographic assets present a high level of ongoing risk. SolidProof’s position is that each company and individual are responsible for their own due diligence and continuous security. SolidProof in no way claims any guarantee of security or functionality of the technology we agree to analyze.

## Description

**Spell Kingdom** is play-to-earn game built on BSC network. One of the simplest and entertaining games you could discover. Spell Kingdom is a new play-to-earn game based on the fantasy metaverse.

## Project Engagement

During the 25th of November 2021, **Spell Kingdom Team** engaged Solidproof.io to audit smart contracts that they created. The engagement was technical in nature and focused on identifying security flaws in the design and implementation of the contracts. They provided Solidproof.io with access to their code repository and whitepaper.

# Vulnerability & Risk Level

Risk represents the probability that a certain source-threat will exploit vulnerability, and the impact of that event on the organization or system. Risk Level is computed based on CVSS version 3.0.

Level	Value	Vulnerability	Risk (Required Action)
<b>Critical</b>	9 - 10	A vulnerability that can disrupt the contract functioning in a number of scenarios, or creates a risk that the contract may be broken.	Immediate action to reduce risk level.
<b>High</b>	7 - 8.9	A vulnerability that affects the desired outcome when using a contract, or provides the opportunity to use a contract in an unintended way.	Implementation of corrective actions as soon as possible.
<b>Medium</b>	4 - 6.9	A vulnerability that could affect the desired outcome of executing the contract in a specific scenario.	Implementation of corrective actions in a certain period.
<b>Low</b>	2 - 3.9	A vulnerability that does not have a significant impact on possible scenarios for the use of the contract and is probably subjective.	Implementation of certain corrective actions or accepting the risk.
<b>Informational</b>	0 - 1.9	A vulnerability that have informational character but is not effecting any of the code.	An observation that does not determine a level of risk

# Auditing Strategy and Techniques Applied

Throughout the review process, care was taken to evaluate the repository for security-related issues, code quality, and adherence to specification and best practices. To do so, reviewed line-by-line by our team of expert pentesters and smart contract developers, documenting any issues as there were discovered.

## Methodology

The auditing process follows a routine series of steps:

1. Code review that includes the following:
  - i) Review of the specifications, sources, and instructions provided to SolidProof to make sure we understand the size, scope, and functionality of the smart contract.
  - ii) Manual review of code, which is the process of reading source code line-by-line in an attempt to identify potential vulnerabilities.
  - iii) Comparison to specification, which is the process of checking whether the code does what the specifications, sources, and instructions provided to SolidProof describe.
2. Testing and automated analysis that includes the following:
  - i) Test coverage analysis, which is the process of determining whether the test cases are actually covering the code and how much code is exercised when we run those test cases.
  - ii) Symbolic execution, which is analysing a program to determine what inputs causes each part of a program to execute.
3. Best practices review, which is a review of the smart contracts to improve efficiency, effectiveness, clarify, maintainability, security, and control based on the established industry and academic practices, recommendations, and research.
4. Specific, itemized, actionable recommendations to help you take steps to secure your smart contracts.

## Used Code from other Frameworks/Smart Contracts (direct imports)

Imported packages:

Dependency / Import Path	Count
@openzeppelin/contracts/access/Ownable.sol	1
@openzeppelin/contracts/token/ERC20/ERC20.sol	1
@openzeppelin/contracts/utils/math/SafeMath.sol	1

## Tested Contract Files

This audit covered the following files listed below with a SHA-1 Hash.

*A file with a different Hash has been modified, intentionally or otherwise, after the security review. A different Hash could be (but not necessarily) an indication of a changed condition or potential vulnerability that was not within the scope of this review.*

### v1.0

File Name	SHA-1 Hash
contracts/Context.sol	49274833516f986f84e8c7b069a02c78ac720200
contracts/IERC20Metadata.sol	7e5dd535e5a620d68b7a07acb188a08d3b2e289c
contracts/AlienToken.sol	70f97c484b73c090f47c197b0bcc92ff952c16f8
contracts/SafeMath.sol	a1f131bd23ac81b49f32e7608b77a6dd25d22c87
contracts/Ownable.sol	d0c36de0676a8ee4d3ee3279a1f691e03e771d65
contracts/ERC20.sol	88671f30b24b6daa313d4dbaea5dff4ff466c621
contracts/IERC20.sol	e5057c5b0b17b386d05d9a3dee94f87478df3fc3

# Metrics

## Source Lines v1.0

## Risk Level v1.0

## Capabilities

### Components

Version	Contracts	Libraries	Interfaces	Abstract
1.0	2	1	2	2

### Exposed Functions

*This section lists functions that are explicitly declared public or payable. Please note that getter methods for public stateVars are not included.*

Version	Public	Payable
1.0	30	0

Version	External	Internal	Private	Pure	View
1.0	13	49	1	13	16

### State Variables

Version	Total	Public
1.0	11	0

### Capabilities

Version	Solidity Versions observed	Experimental Features	Can Receive Funds	Uses Assembly	Has Destroyable Contracts
1.0	<code>^0.8.0</code> <code>^0.8.2</code>			**** (0 asm blocks)	

## Scope of Work

The above token Team provided us with the files that needs to be tested (Github, Bscscan, Etherscan, files, etc.). The scope of the audit is the main contract (usual the same name as team appended with .sol).

We will verify the following claims:

1. Correct implementation of Token standard
2. Deployer cannot mint any new tokens
3. Deployer cannot burn or lock user funds
4. Deployer cannot pause the contract
5. Overall checkup (Smart Contract Security)

## Inheritance Graph v1.0

## Verify Claims

### Correct implementation of Token standard

Tested	Verified
✓	✓

Function	Description	Exist	Tested	Verified
TotalSupply	provides information about the total token supply	✓	✓	✓
BalanceOf	provides account balance of the owner's account	✓	✓	✓
Transfer	executes transfers of a specified number of tokens to a specified address	✓	✓	✓
TransferFrom	executes transfers of a specified number of tokens from a specified address	✓	✓	✓
Approve	allow a spender to withdraw a set number of tokens from a specified account	✓	✓	✓
Allowance	returns a set number of tokens from a spender to the owner	✓	✓	✓

### Optional implementations

Function	Description	Exist	Tested	Verified
renounceOwnership	Owner renounce ownership for more trust	✓	✓	✗

## Deployer cannot mint any new tokens

Name	Exist	Tested	Verified	File
Deployer cannot mint	✓	✓	✓	Main
Comment	Line: -			

Max / Total Supply: 100.000.000

```
constructor() ERC20("AliensWar", "Alien") {  
    _mint(_msgSender(), 50 * 10**6 * 10**18);  
    _isExcludedFromFee[_msgSender()] = true;  
    mktAddress = _msgSender();  
    rewardAddress = _msgSender();  
}
```

```
function _mint(address account↑, uint256 amount↑) internal virtual {  
    require(account↑ != address(0), "ERC20: mint to the zero address");  
  
    _beforeTokenTransfer(address(0), account↑, amount↑);  
  
    _totalSupply += amount↑;  
    _balances[account↑] += amount↑;  
    emit Transfer(address(0), account↑, amount↑);  
  
    _afterTokenTransfer(address(0), account↑, amount↑);  
}
```

## Deployer cannot burn or lock user funds

Name	Exist	Tested	Verified
Deployer cannot lock	✓	✓	✗
Deployer cannot burn	✓	✓	✓

1. approve	→
2. decreaseAllowance	→
3. excludeFromFee	→
4. includeInFee	→
5. increaseAllowance	→
6. renounceOwnership	→
7. setMktAddress	→
8. setMktFee	→
9. setRewardAddress	→
10. setRewardFee	→
11. transfer	→
12. transferFrom	→
13. transferOwnership	→

## Deployer cannot pause the contract

Name	Exist	Tested	Verified
Deployer cannot pause	✓	✓	✓

1. approve	→
2. decreaseAllowance	→
3. excludeFromFee	→
4. includeInFee	→
5. increaseAllowance	→
6. renounceOwnership	→
7. setMktAddress	→
8. setMktFee	→
9. setRewardAddress	→
10. setRewardFee	→
11. transfer	→
12. transferFrom	→
13. transferOwnership	→

	<b>Totals</b>	<b>5</b>	<b>2</b>	<b>858</b>	<b>760</b>	<b>288</b>	<b>444</b>	<b>183</b>	

### Legend

Attribute	Description
Lines	total lines of the source unit
nLines	normalized lines of the source unit (e.g. normalizes functions spanning multiple lines)
nSLOC	normalized source lines of code (only source-code lines; no comments, no blank lines)
Comment Lines	lines containing single or block comments
Complexity Score	a custom complexity score derived from code statements that are known to introduce code complexity (branches, loops, calls, external interfaces, ...)

# Audit Results

# AUDIT PASSED

## Critical issues

- no critical issues found -

## High issues

- no high issues found -

## Medium issues

- no medium issues found -

## Low issues

Issue	File	Type	Line	Description
#1	Main	A floating pragma is set	2	The current pragma Solidity directive is „^0.8.2“.
#2	Main	Missing Zero Address Validation (missing-zero-check)	58, 64	Check that the address is not zero

## Informational issues

- no informational issues found -

# Audit Comments

## 26. November 2021:

- There is still an owner (Owner still has not renounced ownership)
- Misspelling variables
  - mktAddress instead of mktAddress
  - rewardAddrress instead of rewardAddress
- Deployer can lock user funds
  - When sender is not excluded from fee and deployer set \_mktFee/\_rewardFee to a high value (minimum 1000), safeMath will revert the transfer function

```
if(!_isExcludedFromFee[sender↑] || (!_isExcludedFromFee[recipient↑])){
    takeFee = false;
}

if(takeFee){
    uint256 _mktFee = amount↑.mul(mktFee).div(1000);
    uint256 _rewardFee = amount↑.mul(rewardFee).div(1000);

    super.transfer(sender↑, mktAddress, _mktFee); // MKT Fee
    amount↑ = amount↑.sub(_mktFee);
    super.transfer(sender↑, rewardAddrress, _rewardFee); // Reward Fee
    amount↑ = amount↑.sub(_rewardFee);
}
```

The logo features the words "Solid Proofed" in a white, elegant script font. The word "Solid" is positioned above "Proofed". Behind the text is a faint, stylized shield emblem. The shield is divided into four quadrants: the top-left and bottom-right are solid blue, while the top-right and bottom-left contain a grid pattern. The entire design is set against a solid blue background.

Solid  
Proofed
